Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. USB1T1105A

Universal Serial Bus Peripheral Transceiver with Voltage Regulator

General Description

The USB1T1105A is an Universal Serial Bus Specification Rev 2.0 compliant transceiver. The device provides an USB interface for Full-Speed (12Mbit/s) USB applications. The USB1T1105A provides excellent flexibility, allowing differential and single ended inputs while an integrated voltage regulator sets the I/O level to 1.65V to 3.6V. Utilizing an integrated 5.0V to 3.3V voltage regulator, the part can be powered directly from the USB host (V_{BUS}) to minimize the power consumed from the local sources while used in devices with low supply voltages.

The USB1T1105A provides 15kV ESD protection on the USB bus pins (D+/D-). This eliminates the need for any external ESD devices while providing excellent protection to larger and more expensive ASICs and USB controllers.

Features

- Complies with Universal Serial Bus Specification 2.0
- Integrated 5V to 3.3V voltage regulator for powering VBus
- Utilizes digital inputs and outputs to transmit and receive USB cable data
- Supports full speed 12Mbits/s speed data rates
- Ideal for portable electronic devices
- 15kV contact HBM ESD protection on bus pins
- 3.3mm leadless package
- Industry standard HBCC footprint is lead-free

Applications

- Cell phone
- PDA
- Digital camera
- MP3

Terminal Descriptions

Terminal Number	Terminal Name	I/O	Terminal Description
1	\overline{OE}	I	Output Enable: Active LOW enables the transceiver to transmit data on the bus. When not active the transceiver is in the receive mode (CMOS level is relative to V_{CCIO})
2	RCV	O	Receive Data Output: Non-inverted CMOS level output for USB differential Input (CMOS output level is relative to V_{CCIO}). Driven LOW when SUSPN is HIGH; RCV output is stable and preserved during SE0 condition.
3	V_p	O	Single-ended D+ receiver output V_p (CMOS level relative to V_{CCIO}): Used for external detection of SEO, error conditions, speed of connected device; Driven HIGH when no supply connected to V_{CC} and V_{REG} .
4	V_m	O	Single-ended D- receiver output V_m (CMOS level relative to V_{CCIO}): Used for external detection of SEO, error conditions, speed of connected device; Driven HIGH when no supply connected to V_{CC} and V_{REG} .
5	SUSPND	I	Suspend: Enables a low power state (CMOS level is relative to V_{CCIO}). While the SUSPND pin is active (HIGH) it will drive the RCV pin to logic "0" state.
6	MODE	I	MODE input (CMOS level is relative to V_{CCIO}). A HIGH selects the differential input MODE (V_{po} , V_{mo}) whereas a LOW enables the single-ended MODE (V_o , V_{FSEO}) see Table 2 and Table 3
7	V_{CCIO}		Supply Voltage for digital I/O pins (1.65V to 3.6V): When not connected the D+ and D- pins are in 3-STATE. This supply bus is totally independent of V_{CC} (5V) and V_{REG} (3.3V).
8	NC	NC	
10, 9	D+, D-	A/I/O	Data +, Data -: Differential data bus conforming to the USB standard.
11	V_{po} / V_o	I	Driver Data Input (CMOS level is relative to V_{CCIO}); Schmitt trigger input; see Table 2 and Table 3
12	V_{mo} / F_{SEO}	I	Driver Data Input (CMOS level is relative to V_{CCIO}); Schmitt trigger input; see Table 2 and Table 3
13	V_{REG} (3.3V)		Internal Regulator Option: Regulated supply output voltage (3.0V to 3.6V) during 5V operation; decoupling capacitor of at least 0.1 μ F is required.
14	V_{CC} (5.0V)		Internal Regulator Option: Used as supply voltage input (4.0V to 5.5V); can be connected directly to USB line Vbus.

Terminal Number	Terminal Name	I/O	Terminal Description
15	V _{PU} (3.3V)		Pull-up Supply Voltage (3.3V ± 10%); Connect an external 1.5kΩ resistor on D+ (FS data rate); Pin function is controlled by Config input pin: Config = LOW – V _{PU} (3.3V) is floating (High Impedance) for zero pull-up current. Config = HIGH – V _{PU} (3.3V) = 3.3V; internally connected to V _{REG} (3.3V).
16	Config	I	USB connect or disconnect software control input. Configures 3.3V to external 1.5kΩ resistor on D+ when HIGH.
Exposed Diepad	GND	GND	GND supply down bonded to exposed diepad to be connected to the PCB GND.

Functional Description

The USB1T1105A transceiver is designed to convert CMOS data into USB differential bus signal levels and to convert USB differential bus signal to CMOS data.

To minimize EMI and noise the outputs are edge rate controlled with the rise and fall times controlled and defined for full speed data rates. The rise, fall times are balanced between the differential pins to minimize skew.

Table 1 describes the specific pin functionality selection. Table 2, Table 3, and Table 4 describe the specific Truth Tables for Driver and Receiver operating functions.

The USB1T1105A also has the capability of various power supply configurations to support mixed voltage supply applications (see Table 5) and Power Supply Configurations and Options for detailed descriptions.

Power Supply Configurations and Options

The three modes of power supply operation are:

- Normal Mode: Regulated Output and Regulator Bypass
 1. Regulated Output: V_{CCIO} is connected and V_{CC} (5.0) is connected to 5V (4.0V to 5.5V) and the internal voltage regulator then produces 3.3V for the USB connections.
 2. Internal Regulator Bypass Mode: V_{CCIO} is connected and both V_{CC}(5.5) and V_{REG}(3.3) are connected to a 3.3V source (3.0V to 3.6V).

In both cases for normal mode the V_{CCIO} is an independent voltage source (1.65V to 3.6V) that is a function of the external circuit configuration.
- Sharing Mode: V_{CCIO} is only supply connected. V_{CC} and V_{REG} are not connected. In this mode the D+ and D- pins are

3-STATE and the USB1T1105A allows external signals up to 3.6V to share the D+ and D- bus lines. Internally the circuitry limits leakage from D+ and D- pins (maximum 10 μA) and V_{CCIO} such that device is in low power (suspended) state. Terminals V_{busmon} and RCV are forced LOW as an indication of this mode with V_{busmon} being ignored during this state.

- Disable Mode: V_{CCIO} is not connected. V_{CC} is connected, or V_{CC} and V_{REG} are connected. 0V to 3.3V in this mode D+ and D- are 3-STATE and V_{PU} is HIGH Impedance (switch is turned off). The USB1T1105A allows external signals up to 3.6V to share the D+ and D- bus lines. Internally the circuitry limits leakage from D+ and D- terminals (maximum 10μA).

A summary of the Supply Configurations is described in Table 5.

Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part.
